HDSDP for Optimal Diagonal Pre-conditioning

July 26, 2022

In this report we present the experiments results on HDSDP for the optimal diagonal pre-conditioning problem.

Updates on July 26th, 2022

• Iterative & bisection

On random and sparse problems, the iterative methods work well but for the real-life matrices the iterative method progresses slowly as the SDP becomes increasingly ill-conditioned.

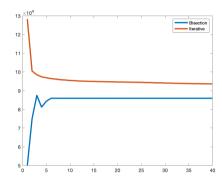

Figure 1. Convergence of the two methods

• Randomly sampling

Random sampling works quite well on regression datasets. In general only $1\% \sim 10\%$ of data is needed to reduce condition number to a desirable level.

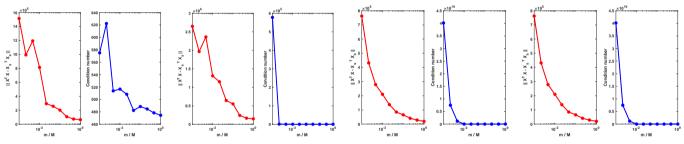

Figure 2. Pre-conditioning by randomly sampling

• Comparison with Ruiz-scaling

In a word, when SDP is solved accurately, two-sided pre-conditioning is always better than Ruiz-scaling ($\|\cdot\|_{\infty}$), especially for matrices with all-one nonzero entries. Test is over 43 Suite-sparse instances.

Average reduction of Opt. precond	69.7%
Average reduction of Ruiz-scaing	46.8%
Average improvement of Opt. over Ruiz	33.0%

Table 1. Summary of camparison between two-sided and Ruiz pre-conditioning

1 Experiment Setup

In this section we introduce the detailed experiment setup for the optimal diagonal-precondition problem.

1.1 Formulation

Given a full-rank matrix $X \in \mathbb{R}^{m \times n}$, the optimal pre-conditioning problem solves the SDP instance

 $\max_{\tau,D}$

subject to
$$D \leq M$$

 $\tau M - D \leq 0$,

where $M = X^{\top}X \in \mathbb{S}_{+}^{n \times n}$ and $D^{1/2}$ is applied as the pre-conditioner.

1.2 Datasets and Processing

To verify the effect of the optimal diagonal preconditioner, we test the algorithm on a extensively large collection of matrices. Currently there are threes sources for our test.

• Tim Davis SuiteSparse Dataset (Ready)

https://sparse.tamu.edu

In this dataset we are for now testing matrices X with $n \leq 1000$.

• LIBSVM Regression (Ready)

https://www.csie.ntu.edu.tw/~cjlin/libsvmtools/datasets/regression.html

We take the regression $(\|X\beta - y\|^2)$ datasets from LIBSVM.

• OPENML Machine Learning Regression (Ready)

https://www.openml.org/search?type=data

We take the regression $(\|X\beta - y\|^2)$ datasets from OPENML

and without loss of generality, we choose the matrices whose condition number $\leq 10^8$ and if a matrix does not meet the condition, we add diagonal perturbation $M \leftarrow M + \varepsilon I$ till $\kappa(M) \leq 10^8$.

1.3 Experiment Environment

All the experiments in the report are carried out on Mac Mini with Apple Silicon and 16 GB memory.

1.4 Solver and Configuration

We adopt the HDSDP solver to solve the optimal diagonal pre-conditioning problem. To enhance the performance, we let the solver start from $(\tau, d) = (-10^{\alpha}, 0)$ for some $\alpha \ge 1$.

1.5 Evaluation

For each matrix X, we report the following statistics

• $\kappa(M)$ (Marked by Cbef)

Condition number of M

• $\kappa(D^{-1/2}MD^{-1/2})$ (Marked by Caft)

Condition number after pre-conditioning

The relative reduction in condition number by $\operatorname{rdc}(M) = 1 - \frac{\kappa(D^{-1/2}MD^{-1/2})}{\kappa(M)}$.

e.g., if rdc(M) = 0.99, then pre-conditioning reduces the condition number by 99%.

Remark 1. For some problems HDSDP fails and in this case rdc(M) may be less than 0. We drop these cases from the results presented below.

A Suite-sparse Benchmark

A.1 Summary statistics

We test 391 small-medium sized Suite sparse matrices and

Reduction	Number
≥80%	121
≥50%	190
≥20%	261

Average reduction	49.7%
Average time	1.29

Table 2. Average condition number reduction

A.2 Smaller Matrices

Table 9. SuiteSparse Matrix Collection (Two-sided)

Remark 2. When doing two-sided pre-conditioning, M has no perturbation on the diagonal.

A.2.4 Random Sampling

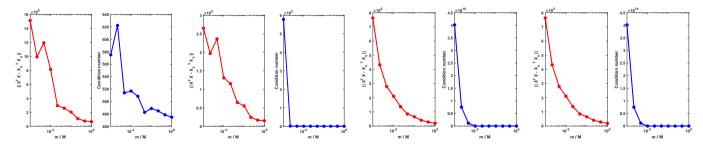

For regression datasets that enjoy statistical properties, we consider the following randomized pre-conditioning method. Given $X \in \mathbb{R}^{M \times n}$, the randomized method

- Samples $m = \rho M$ rows of X without replacement and get $X' \in \mathbb{R}^{m \times n}$
- Run pre-conditioning algorithm on X' (i.e., $X'{D'}^{1/2}$)
- Apply D' as a pre-conditioner for X

We use very large regression datasets from ${\tt LIBSVM}$ and ${\tt OPENMP}$

Dataset	Number of samples
YearPredictionMSD	463715
YearPredictionMSD-t	51630
