HDSDP for Optimal Diagonal Pre-conditioning

 $July\ 14,\ 2022$

In this report we present the experiments results on HDSDP for the optimal diagonal pre-conditioning problem.

1 Experiment Setup

In this section we introduce the detailed experiment setup for the optimal diagonal-precondition problem.

1.1 Formulation

Given a full-rank matrix $X \in \mathbb{R}^{m \times n}$, the optimal pre-conditioning problem solves the SDP instance

$$\begin{array}{ccc} \max & \tau \\ \text{subject to} & D \preceq M \\ \tau M - D \preceq 0, \end{array}$$

where $M = X^{\top}X \in \mathbb{S}_{+}^{n \times n}$ and $D^{1/2}$ is applied as the pre-conditioner.

1.2 Datasets and Processing

To verify the effect of the optimal diagonal preconditioner, we test the algorithm on a extensively large collection of matrices. Currently there are threes sources for our test.

ullet Tim Davis SuiteSparse Dataset (Ready)

https://sparse.tamu.edu

In this dataset we are for now testing matrices X with $n \leq 1000$.

• LIBSVM Regression (Ready)

https://www.csie.ntu.edu.tw/~cjlin/libsvmtools/datasets/regression.html

We take the regression $(\|X\beta - y\|^2)$ datasets from LIBSVM.

• OPENML Machine Learning Regression (Preparing)

https://www.openml.org/search?type=data

Still in preparation

and without loss of generality, we choose the matrices whose condition number $\leq 10^8$ and if a matrix does not meet the condition, we add diagonal perturbation $M \leftarrow M + \varepsilon I$ till $\kappa(M) \leq 10^8$.

1.3 Experiment Environment

All the experiments in the report are carried out on Mac Mini with Apple Silicon and 16 GB memory.

1.4 Solver and Configuration

We adopt the HDSDP solver to solve the optimal diagonal pre-conditioning problem. To enhance the performance, we let the solver start from $(\tau, d) = (-10^{\alpha}, 0)$ for some $\alpha \ge 1$.

1.5 Evaluation

For each matrix X, we report the following statistics

• $\kappa(M)$ (Marked by Cbef)

Condition number of M

• $\kappa(D^{-1/2}MD^{-1/2})$ (Marked by Caft)

Condition number after pre-conditioning

• rdc(M) (Marked by Reduce)

The relative reduction in condition number by $\mathrm{rdc}(M) = 1 - \frac{\kappa(D^{-1/2}MD^{-1/2})}{\kappa(M)}$.

e.g., if rdc(M) = 0.99, then pre-conditioning reduces the condition number by 99%.

Remark 1. For some problems HDSDP fails and in this case rdc(M) may be less than 0. We drop these cases from the results presented below.

A Suite-sparse Benchmark

A.1 Summary statistics

We test 391 small-medium sized Suite sparse matrices and

Reduction	Number
≥80%	121
≥50%	190
$\geq 20\%$	261
•	

Average reduction	49.7%
Average time	1.29

Table 1. Average condition number reduction
